

# PiggyBack™

Add 4 stations to any 24VAC controller

Add long watering times for drip

Manual start timer for small residential

Can recycle for new Lawn or ground cover

Upgrade your controller

UNIVERSAL 4 STATION MODULE

1 minute to 4 hours watering time

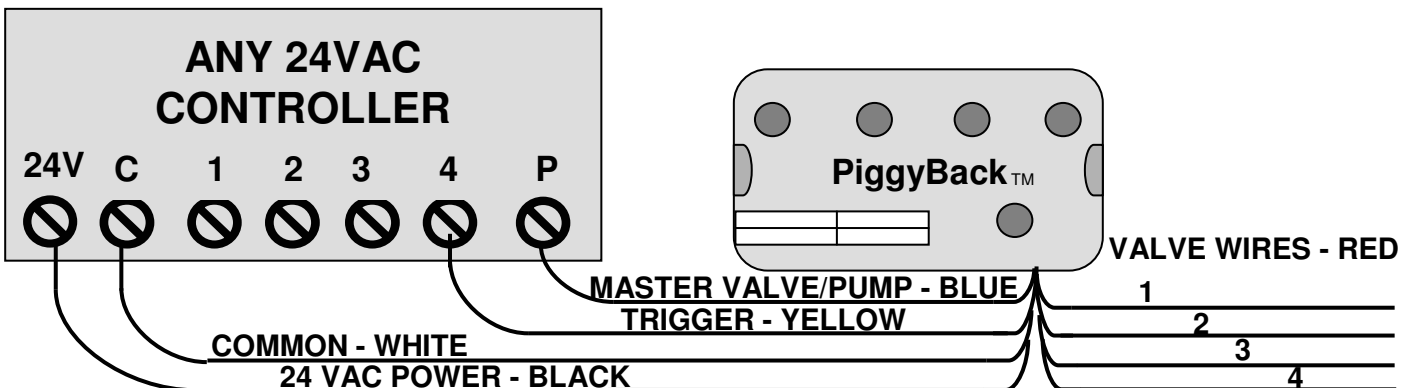

No start times to set

Manual start and advance button

2 Amp overload protection

**PiggyBack™** is a hybrid 4 station timer used to increase the capacity of any 24VAC controller. You can upgrade an 8 station controller to 12 stations, or a 12 to a 16, etc. **PiggyBack™** is especially useful when adding more valves with **DOUBLER®** & **DOUBLER<sup>2</sup>®** where all the stations in the controller are already in use. Adding another controller complicates your life every time the weather changes or you have to reprogram your controllers.

- **PiggyBack™** starts after your existing controller completes its cycle. There are no start times to set.
- **PiggyBack™** does not “use up” any stations on your existing controller. It simply continues the program you already have set on your controller.
- Shorten total watering time by connecting the **PiggyBack™** to any station on the controller so that it can water drip systems while the controller simultaneously operates the sprinklers
- **PiggyBack™** becomes part of your controller so you won't have to worry about interconnected controller issues associated with multi-controller systems
- **PiggyBack™** is one of the most reliable parts of any sprinkler system, with a 2Amp fuse and optically isolated outputs on each station.
- Add even more stations by connecting a second **PiggyBack™** to the last station of the first **PiggyBack™**
